Captura

Company Overview Captura is a pioneering climate-tech company that focuses on "Direct Ocean Capture." While many companies try to clean the air, Captura looks to the sea. They develop technology to remove excess carbon dioxide from the ocean to help heal marine ecosystems and fight climate change.

ESG Focus: Direct Ocean Capture (DOC)

Why (The Problem) The ocean absorbs about 30% of all CO2 produced by humans. This makes the water more acidic, which kills coral reefs and harms shellfish. As the ocean becomes "full" of carbon, it can no longer help cool the planet effectively.

How (The Solution) Captura uses a specialized process that pulls seawater into a facility and uses renewable electricity to extract the CO2 without using any harmful chemicals. Once the carbon is removed, the "purified" water is put back into the ocean, where it is now ready to absorb more CO2 from the atmosphere naturally.

What (The Outcome) This creates a "Negative Emissions" cycle. By cleaning the water, they indirectly clean the air. The captured CO2 can then be buried deep underground or used to create sustainable building materials, ensuring it never returns to the atmosphere.

Impact: Their technology is designed to scale to millions of tons of CO2 removal. Because the facility only uses sea water and electricity, it has a very small footprint on land compared to massive tree-planting projects.
