Carbonwave

Company Overview Carbonwave is a public benefit corporation that turns an environmental crisis into a resource. They collect "Sargassum" (a type of seaweed that is currently over-blooming and rotting on beaches) and transform it into high-value materials for cosmetics, fertilizers, and even vegan leather.

ESG Focus: Regenerative Seaweed Science (Sargassum Upcycling)

Why (The Problem) Due to rising ocean temperatures and fertilizer runoff, huge mats of Sargassum seaweed are overwhelming coastlines from Africa to the Caribbean. When it rots on the beach, it releases methane (a potent greenhouse gas), kills marine life by blocking sunlight, and hurts local tourism economies.

How (The Solution) Carbonwave operates a large-scale collection and processing network. They harvest the seaweed before it rots and use advanced extraction methods to separate its components. They turn these into "SeaBalance"—the world's first seaweed-based cosmetic emulsifier—as well as liquid fertilizers that help farmers reduce their reliance on chemicals.

What (The Outcome) This creates a "Regenerative" supply chain. Instead of treating the seaweed bloom as waste, it becomes a replacement for petroleum-based chemicals in beauty products and plastic-based fabrics. It cleans up the oceans while providing sustainable, plant-based ingredients for global industries.

Impact: The company has sequestered thousands of tons of CO2 by preventing seaweed from decomposing. Their technology aims to protect coastal ecosystems and provide new, green jobs for communities affected by the seaweed crisis.
