LanzaTech

Company Overview LanzaTech is an innovative American carbon-recycling company. While they aren't a traditional beauty brand, they work with companies like Zara and Coty to create sustainable products. They specialize in "Carbon Capture," turning industrial pollution into useful materials like fabric, fuel, and even perfume alcohol.

ESG Focus: Carbon Transformation (Pollution-to-Product)

Why (The Problem) Most everyday products—from polyester clothes to plastic bottles—are made from fossil fuels (petrol). Extracting these fuels releases massive amounts of CO2 into the atmosphere, which causes global warming. Meanwhile, factories and steel mills are constantly pumping out waste gases that further pollute the air.

How (The Solution) LanzaTech uses a unique biological process. They "feed" waste carbon gases from factories to special bacteria in large tanks. The bacteria digest the pollution and turn it into ethanol. This ethanol is then used as a building block to create sustainable polyester for clothing or alcohol for fragrances, bypassing the need for oil.

What (The Outcome) This creates "Circular Carbon" materials. Instead of pulling new oil out of the ground, the company recycles carbon that is already in the air. This turns a climate problem (pollution) into a resource, significantly reducing the carbon footprint of consumer goods.

Impact: The company has already diverted over 200,000 tonnes of CO2 from the atmosphere. They are currently expanding their technology to transform household trash and agricultural waste into sustainable aviation fuel (SAF).
