Loliware

Company Overview Loliware is an American materials science company that creates "Seaweed-Derived Plastics." They focus entirely on eliminating single-use plastic utensils and straws by replacing them with high-performing, ocean-safe materials that behave exactly like plastic but disappear naturally.

ESG Focus: Seaweed Tech (Plastic-Free Utensils)

Why (The Problem) Single-use plastic straws and utensils are among the most common items found in ocean pollution. They are rarely recycled due to their size and shape. Even "bioplastics" made from corn (PLA) require industrial composting facilities to break down; if they end up in the ocean, they remain just as dangerous as regular plastic.

How (The Solution) Loliware uses seaweed as its main ingredient. Seaweed absorbs CO2 rapidly as it grows, making it a carbon-capturing crop. They process this seaweed into pellets that can be fed into existing plastic manufacturing machines. This allows factories to mass-produce straws and utensils without needing to buy new equipment.

What (The Outcome) This results in "Blue Carbon" products that are engineered to disappear. A Loliware straw feels sturdy and won't get soggy in your drink like paper straws do. However, once discarded, it breaks down completely in water or soil within weeks, leaving no microplastics or toxic residues behind.

Impact: Loliware has successfully introduced its seaweed straws to major stadium events and coffee chains. By utilizing a crop that grows without freshwater or fertilizers, they are building a truly scalable alternative to the petroleum economy.
