P2 Science

Company Overview P2 Science is a "Green Chemistry" company founded by scientists from Yale University. They specialize in creating high-performance ingredients for fragrances and cosmetics using renewable forest by-products instead of chemicals derived from crude oil.

ESG Focus: Botanical Polymers (Terpene-Derived Chemistry)

Why (The Problem) Most scents and textures in beauty products are created using petrochemicals (oil). These ingredients are not renewable, can be irritating to the skin, and often don't break down easily in the environment. The supply chain for these chemicals is also highly carbon-intensive.

How (The Solution) P2 Science uses a patented process to transform "terpenes"—which are natural by-products of the paper and pine industry—into specialized polymers. Their signature ingredient, "Citropol," provides the silky feeling of silicone but is made entirely from 100% natural, upcycled forest waste.

What (The Outcome) This results in "Bio-derived" performance ingredients. These products are identical in quality to luxury synthetics but are inherently biodegradable and sustainably sourced. By using local, renewable resources, they reduce the environmental impact of the entire beauty supply chain.

Impact: Their manufacturing process is designed to be "zero-waste," where almost every part of the raw material is converted into a useful product. They are helping the world's biggest perfume houses move away from oil-based scents toward a future powered by plants and trees.
