Company Overview: SK hynix

SK hynix is a South Korean semiconductor giant and a global leader in the memory chip industry. It is best known for producing DRAM and NAND flash memory, which are essential parts of computers and smartphones. Recently, the company has become an undisputed pioneer in HBM (High Bandwidth Memory), a special type of high-speed memory that is required for Artificial Intelligence (AI) to work properly. SK hynix does not just want to be a tech leader; its vision is to lead the AI infrastructure era by balancing technological innovation with social value, making sure that its growth benefits both the planet and the community.

ESG: SK hynix

The Water Stewardship & Eco-Tech Program

Why, How, and What

- SK hynix understands that making semiconductors requires a massive amount of water, which can put a strain on the environment. To address this, they focus on "Water Stewardship," recycling over 43 million tons of water every year. They started by investigating exactly where water was being wasted and found ways to clean and reuse it for cooling systems and cleaning wafers. Furthermore, they developed the "Water-free Scrubber," a clever technology that filters harmful emissions from the manufacturing process without using any water at all. As a result, the company saves a huge amount of natural resources while still keeping their factories running at full speed.

Social: Happiness GPS

Why, How, and What

- The company believes in using its advanced technology to solve real human problems. They realized that seniors with dementia and people with disabilities often face the danger of getting lost. To help, SK hynix created the "Happiness GPS" program, providing free wearable tracking devices that use semiconductor and AI technology. These devices allow families to see the location of their loved ones in real-time, preventing accidents and saving lives. By donating tens of thousands of these devices, SK hynix proves that high-tech chips can provide emotional peace and safety to the most vulnerable people in society.

Application for SMEs

- Small companies can start their ESG journey by doing a "Resource Audit." You don't need expensive technology to track how much power or water your office or small factory is using. By turning this usage into clear data, you can find simple ways to cut waste and save money. Additionally, look for "Industry Alliances." Just as SK hynix supports its suppliers through the "Eco Alliance," small businesses can join local groups to get free advice on how to be more eco-friendly, which helps them stay competitive when selling to bigger clients.

Company Overview: HIVE Digital Technologies

HIVE Digital Technologies is a forward-thinking company that bridges the gap between digital finance and green energy. Based in Canada, the company focuses on Bitcoin mining and High-Performance Computing (HPC) for AI applications. What makes HIVE unique is its commitment to the environment in an industry often criticized for high energy use. They operate data centers in cold climates like Sweden and Iceland, which allows them to use the naturally cold air for cooling instead of expensive, energy-hungry air conditioning.

ESG: HIVE

100% Green Energy & Heat Re-use

Why, How, and What

- Data centers and AI servers generate an incredible amount of heat and require constant electricity. HIVE decided that they would only use 100% green energy, sourcing all their power from hydroelectric and geothermal plants. This means their digital activities do not contribute to carbon pollution. Even more impressively, they are working on "Heat Re-use" projects. Instead of letting the hot air from their servers go to waste, they are exploring ways to pipe that heat into local greenhouses. This allows farmers in cold regions to grow fresh vegetables even in winter, turning "waste heat" into a valuable resource for the local food supply.

Application for SMEs

- Small businesses that use a lot of digital tools can practice "Green Sourcing." When you choose a company to host your website or store your data in the cloud, pick a provider that uses renewable energy. It is a simple choice that reduces your "digital carbon footprint" without changing your daily work. You can also look for "Circular Energy" opportunities. For example, if your business has machines that get hot, think about if that warmth can be used to heat your office space during the winter. Using what you already have in a smarter way is the easiest way to start being sustainable.
