Sulapac

Company Overview Sulapac is a Finnish material science company founded by two biochemists. They create a patented material that looks and feels like plastic but is made entirely from sustainably sourced wood and natural binders. They work with luxury brands like Chanel to replace plastic jars and caps.

ESG Focus: Microplastic-Free Packaging (Bio-based Polymers)

Why (The Problem) Traditional plastic packaging often ends up in the ocean, where it breaks down into "microplastics." These tiny particles never truly disappear; they enter the food chain, harm wildlife, and have even been found in human bodies. Many "biodegradable" plastics still leave these micro-residues behind.

How (The Solution) Sulapac materials are designed to "mimic nature." They use wood chips from industrial side streams (leftovers that would be burned) and combine them with plant-based binders. The material can be used in existing plastic-molding machines, making it easy for companies to switch without buying new equipment.

What (The Outcome) This results in a material that is truly "circular." If a Sulapac jar accidentally ends up in the ocean, it biodegrades completely into CO_2, water, and biomass—just like a fallen leaf. It leaves zero permanent microplastics behind, making it a safe choice for both people and the planet.

Impact: Sulapac has been recognized as one of the most promising circular economy startups in Europe. By 2026, they aim to have their core materials show a significantly better life-cycle impact than any plastic benchmark, moving the world toward a "fossil-free" future.
